Human research plays a pivotal role in advancing our understanding of human behavior, health, and society. However, the path of research is fraught with complexities and challenges that can undermine the integrity and validity of findings. In the groundbreaking book "Pitfalls in Human Research: Ten Pivotal Points," seasoned researchers uncover the ethical dilemmas, methodological pitfalls, and hidden biases that researchers must navigate to ensure the highest standards of research practice.

Navigating the Ten Pivotal Points in Human Research

- Informed Consent:** Ensuring that participants fully understand the nature and risks of a study and provide voluntary consent.

2. **Confidentiality and Privacy:** Protecting the privacy of participants' data and personal information throughout the research process.

Introduction

A significant increase in the frequency of research that uses human subjects is observable. The IRB presents a functional administrative body that was set up for the primary purpose of protecting and safeguarding the welfare and rights of human research participants (Nurunnabi, 2014). More importantly, the IRB is concerned with human research subjects recruited for research endeavors performed under the portents of the institution linked to it.

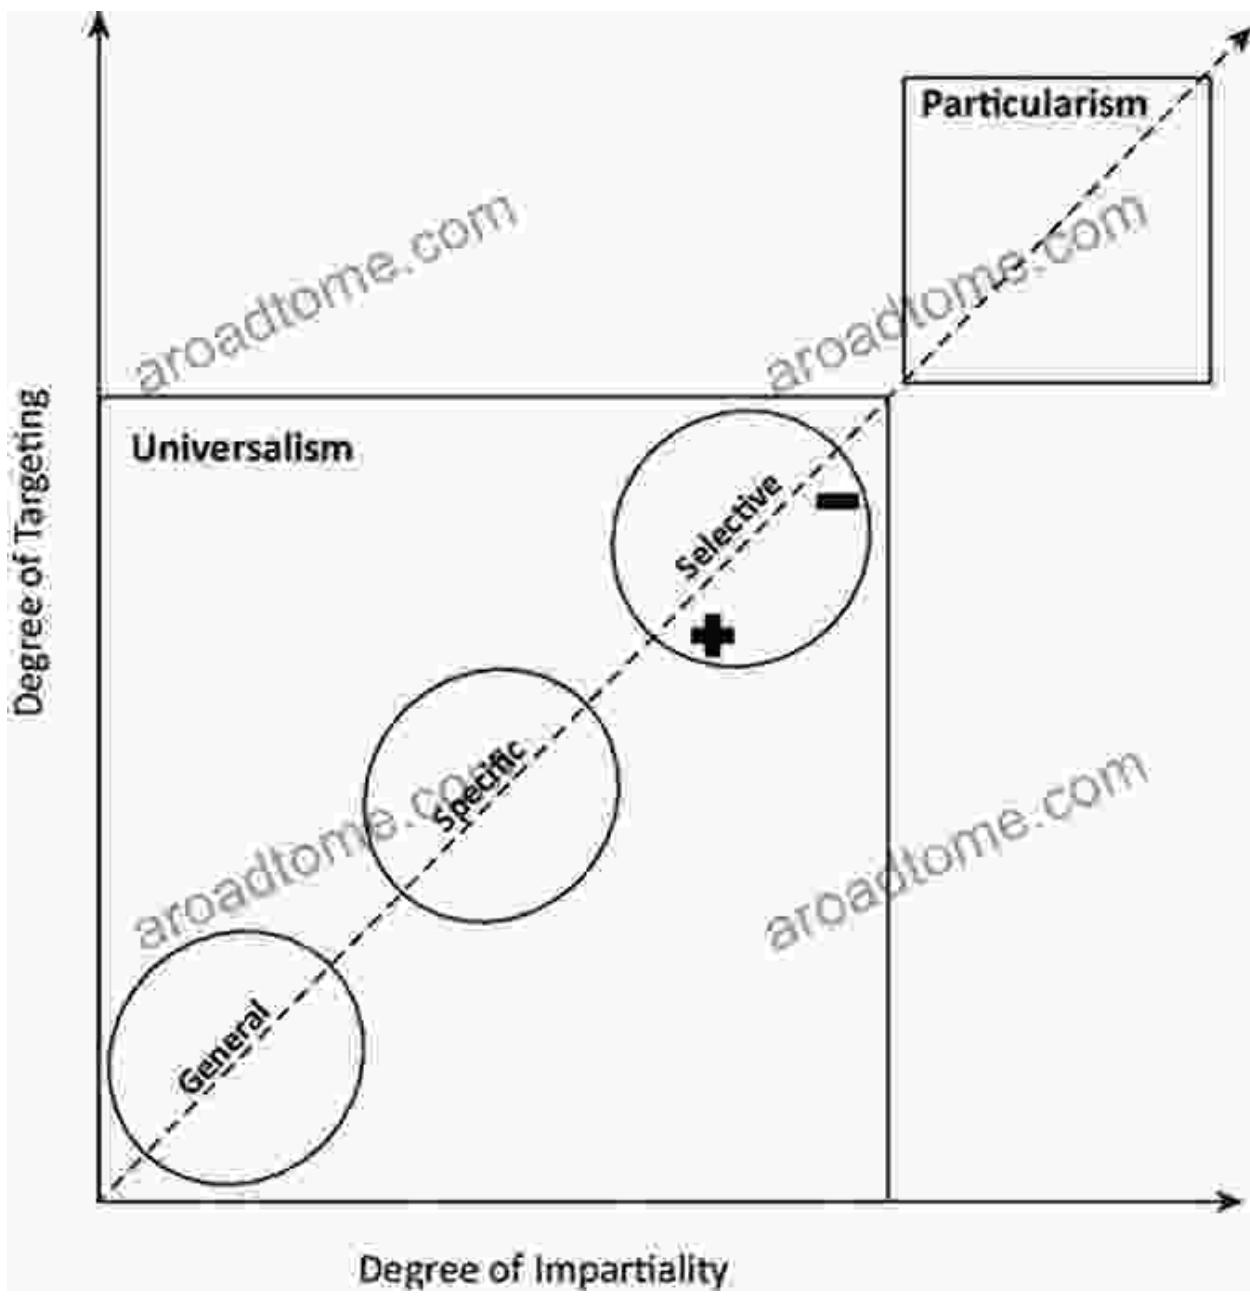

Among the essential responsibilities of the IRB is reviewing all research whose activities involve human subjects regardless of whether those researches are independently conducted or funded (Nurunnabi, 2014). Also, in these settings, the IRB serves as a protector of the privacy pertaining to the enlisted human subjects in research. In this regard, this body can monitor, accept, disapprove, and cause changes in any research designs that fall under its authority as is postulated in both the institutional and federal regulations policy.

The IRB Functions

The IRB further functions as a ethical committee whose mandate lies in reviewing, approving, and monitoring both behavioral and biomedical research whose subjects are humans (Nurunnabi, 2014). The protection against and the prevention of physiological and physical harm from befelling the human research subjects is the most pivotal priority of the IRB (Nurunnabi, 2014). The IRB's responsibilities and priorities stem from an increase in the existence of unethical practices linked to scientific research. A significant number of such research violated the rights, welfare, and privacy of human research participants necessitating for the designation of an administrative body by the federal government that would function as a streamliner for the myriad of research processes employed by research institutions to enforce the protection of the human participants (Enfield & Truwit, 2008).

Inasmuch as the composition of the IRB stands at five members, it is mandatory that the members making up the board be from different and diverse backgrounds with considerations based on sensitivity to community attitudes, cultural, and racial heritage. This requirement is aimed at ensuring and promoting not only respect but also objectivity in the IRB's advice regarding human research subjects. The board is further responsible for ascertaining that research activities are within institutional regulations and rules in line with the concerned federal laws in conjunction with the expected standards of practice and conduct on a professional basis, through reviews (Enfield & Truwit, 2008). This body is given the authority to outsource the competence and expertise of other individuals on specific topics to broaden further the perspectives and counsel offered by the board in light of safeguarding the welfare of vulnerable participants. However, voting priority is given to the members of the IRB so much so that the invited individuals are not allowed to vote in the ultimate decisions made by the board. In addition to primarily protecting human research subjects, the IRB also protects the researchers of the institutions with which it is affiliated. The way this happens is that researchers may be faced with conflicts between their desire to gain knowledge through

3. **Objectivity and Bias:** Acknowledging and mitigating personal biases that may influence research design, data collection, and interpretation.

4. **Research Design:** Selecting the appropriate research design and ensuring methodological rigor to minimize confounding variables and

enhance internal validity.

5. **Data Collection:** Employing reliable and valid methods for collecting data, minimizing measurement error and maximizing data quality.

6. **Data Analysis:** Applying appropriate statistical techniques to analyze data objectively and avoid overinterpretation or manipulation.

7. **Interpretation and Reporting:** Clearly and accurately presenting research findings, acknowledging limitations, and avoiding

sensationalism or overgeneralization.

8. **Scientific Misconduct:** Understanding and addressing instances of plagiarism, data fabrication, and other unethical behaviors that

threaten research integrity.

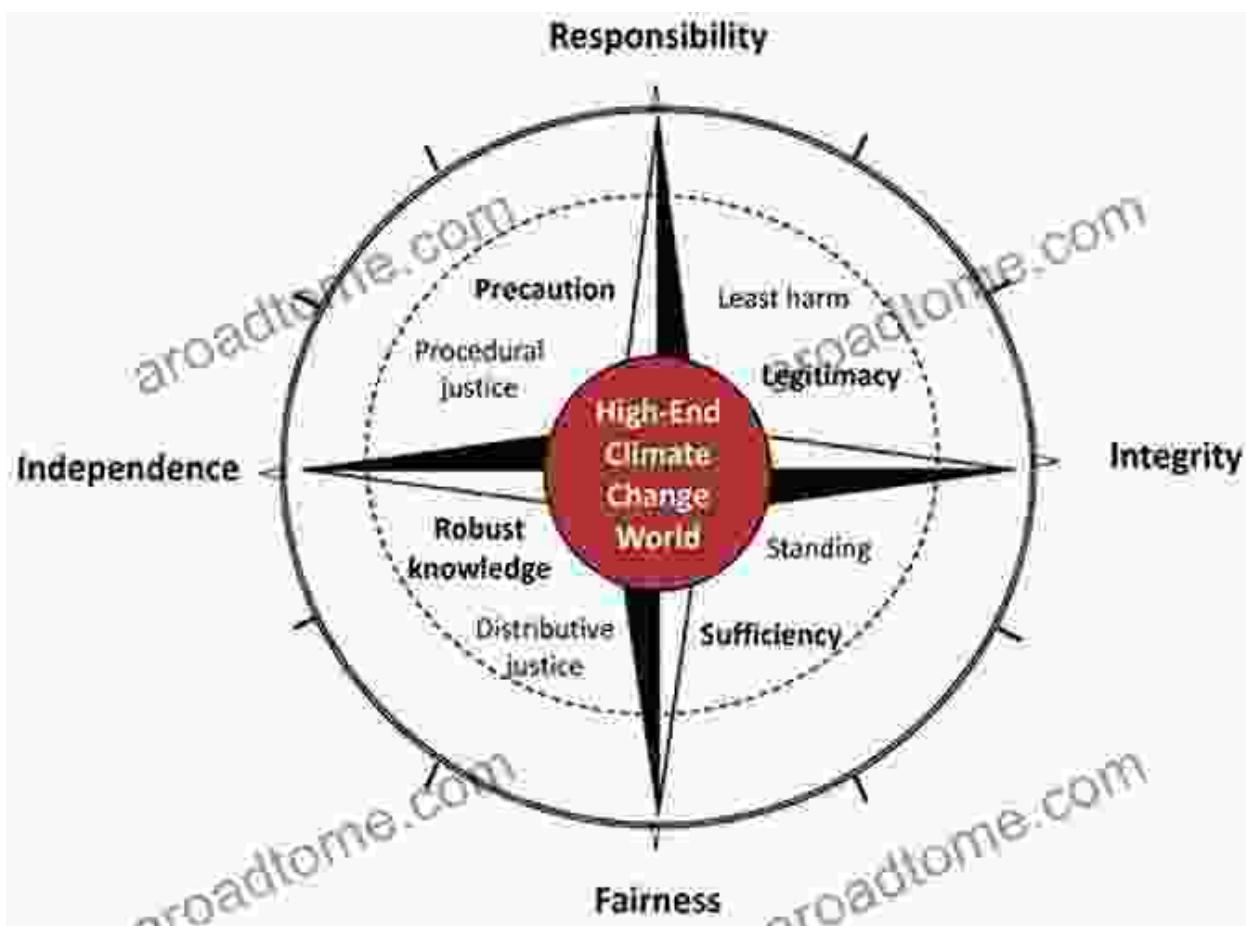

9. **Research Collaboration:** Building effective partnerships with colleagues, institutions, and participants to enhance research quality

and foster innovation.

10. **Research Ethics:** Adhering to ethical guidelines, seeking ethical approval, and ensuring that research respects the rights and dignity of

participants.
